1954 CENSUS OF MANUFACTURES REPORTS

INDUSTRY BULLETINS—Each bulletin contains introductory text and data for groups of related manufacturing industries, showing for each industry: 1954 statistics on detailed product shipments and materials consumption in terms of quantity and value, cost of fuels and electric energy, value added by manufacture, employment, payrolls, man-hours, inventories, new capital expenditures, horsepower of power equipment, and number of manufacturing establishments, with historical comparisons. Value of shipments, cost of materials, capital expenditures, and employment and payroll data are shown for each industry by geographic region and State. Number of employees, value added by manufacture, and number of establishments are shown by size class of establishment within industry. Data are provided on selected measures for specialized product plants.

STATE BULLETINS—Each bulletin contains introductory text and data for each State, showing for the State: 1954 statistics on value of shipments, value added by manufacture, employment, payrolls, man-hours, new capital expenditures, and number of manufacturing establishments for important industries and industry groups, with historical comparisons. For the State's important metropolitan areas and industrial counties, similar data are shown by industry group. Totals for all manufacturing industries are shown for the above statistics (except value of shipments) for all counties, standard metropolitan areas, and cities with 10,000 or more population. The number of establishments in each major industry group are presented by size of establishment within county.

SUBJECT BULLETINS—Each bulletin contains introductory text and detailed statistics for an individual subject, such as: Employment, payrolls, and man-hours; size of establishments; inventories; new capital expenditures; horsepower of power equipment; fuels and electric energy; industrial water use; important materials consumed.

CENSUS VOLUMES—The Industry, State, and Subject bulletins described above will be consolidated and issued as three separate bound volumes, together with full explanatory texts and technical appendixes. In addition, there will be a general summary chapter in all three volumes, summary statistics chapters for major industry groups in the Industry volume, and summary statistics chapters for geographic divisions in the Area volume.

SUGGESTED IDENTIFICATION

INTRODUCTION

OUTLINE

1. Description of Report
2. Definition of Manufacturing Industries
3. Definition of Establishment
4. Industry Classification of Establishment
5. Cost of Materials, etc., Consumed
6. Individual Materials Consumed
7. Value of Shipments
8. Plant Specialization Data

1. Description of Report

This report presents materials consumption data for specialized establishments in the metal product and chemical areas of the manufacturing economy. The data were derived from a special tabulation of the 1954 Census of Manufactures which was compiled by the Bureau of the Census for the Business and Defense Services Administration.

In previous Census publications, detailed materials consumed data were, with minor exceptions, shown only at the total industry level. This publication is part of the program, begun in the 1954 Census of Manufactures, of showing data for establishments by degree of specialization in product classes and all primary products of each industry. Specialized establishments are those whose shipments of a single product class represent 90 percent or more of the total products shipped by the establishment or whose shipments of all primary products (products primary to the industry in which the establishment is classified) represent 90 percent or more of all product shipments of the establishment (see section 8 of this introduction).

The material requirements within an industry may vary widely from establishment to establishment. Where such variations occur, one of the important contributing factors may be the difference in material requirements of the various products of an industry when these products are produced in different proportions by establishments in the industry. The data in this bulletin provide some information on these differences.

The pattern of purchased materials consumed by specialized establishments is not necessarily typical of the process for making a given product class. Highly specialized establishments often manufacture only a portion of the total output of a given product class. Less specialized establishments in the same industry and establishments classified in other industries may also be important producers. In addition to the degree of product specialization, materials requirements may vary considerably because the processes carried on by particular establishments in the industry may be markedly different. The table which follows shows value of shipments for all establishments as well as specialized establishments indicating coverage of the specialized establishment data at the 4-digit level. Table 5B of the 1954 Census of Manufactures Volume II, Industry Statistics, for the primary industry of the product class provides information as to the various industries in which a given product class is manufactured.

The study covered only Major Groups 28 and 33-38. Also, the data for some of the industries and product classes were withheld for a variety of reasons, principally to avoid disclosing the operations of individual companies.

Data in these tables include (1) total value of shipments for the entire 4-digit industry, (2) both value of shipments and selected materials consumed for establishments specializing 90 percent or more in the primary products of the industry, and (3) value of shipments and selected materials consumed by establishments specializing 90 percent or more in specified product classes.

2. Definition of Manufacturing Industries

The 1954 Census of Manufactures covers all establishments primarily engaged in manufacturing as defined in the Standard Industrial Classification Manual, Volume I, Manufacturing Industries, dated November 1945, as amended by the Bureau of the Budget. This system of classification is in general use among Government agencies and also outside the

Government. The Manual defines manufacturing as the mechanical or chemical transformation of inorganic or organic substances into new products. The assembly of component parts of products is also considered to be manufacturing if the resulting product is neither a structure nor other fixed improvement. These activities are usually carried on in plants, factories, or mills, which characteristically use power-driven machines and materials-handling equipment.

Manufacturing production is usually carried on for the wholesale market, for transfer to other plants of the same company, or to the order of industrial users rather than for direct sale to the household consumer. Some manufacturers in a few industries sell chiefly at retail to household consumers through the mail, through house-to-house routes, or through salesmen. Some activities of a service nature (enameling, engraving, etc.) when performed primarily for the trade are included in manufacturing; when performed primarily to the order of the household consumer, they are considered non-manufacturing.

The Standard Industrial Classification Manual, issued November 1945, was amended slightly by the Bureau of the Budget prior to the 1954 Census. In classifying establishments by industry in the 1954 Census of Manufactures, the Census Bureau followed the amended version of the Standard Industrial Classification. Significant changes in the standard classification from the 1945 edition are discussed in the introductory texts for the industries affected.

3. Definition of Establishment

The Census of Manufactures is conducted on an establishment basis. That is, a company operating establishments at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if the plant records permit such a separation and if the activities are substantial in size. Census tabulations of establishment reports, therefore, differ substantially from those prepared on a company basis, i.e., from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the nonmanufacturing activities of companies primarily engaged in manufacturing. Census figures will also differ to some extent from other tabulations based on establishment reports, where the definition of an establishment as to location and line of activity is not so rigidly applied.

In 1954, as in earlier years, a minimum size limit was set for including establishments in the census. In both the 1954 and 1947 Censuses, reports were required from all establishments employing one or more persons at any time during the census year, whereas in prior Censuses establishments with less than \$5,000 value of products were excluded. The change in the minimum size limit in 1947 does not appreciably affect the historical comparability of the Census figures except for data on number of establishments for a few industries.

4. Industry Classification of Establishments

Each of the establishments covered in the census was classified in one of approximately 460 manufacturing industries in accordance with the industry definitions embodied in the Standard Industrial Classification system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or more or less closely related group of products. The product groupings from which industry classifications are derived are based on such considerations as whether they are typically produced by the same establishment, similarity of manufacturing processes, types of material used, types of customers, and the like. The group of products assigned to an industry is said to be "primary" to that industry. Accordingly, an establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. In a few instances, however, the industry classification of an establishment is determined not only by the products it makes but also by the processes employed in making those products.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The value of shipments shown for an industry, therefore, reflect not only the primary activities of the establishments in that industry but also their activities of a secondary nature.

5. Cost of Materials, etc., Consumed

A summary inquiry on the 1954 Census report forms requested information on the cost of materials, supplies, semi-finished goods, fuels and electric energy, actually consumed or put into production during the year, whether purchased, withdrawn from inventories, or received from other establishments of the company, as well as the cost of contract work. "Cost" refers to direct charges actually paid or payable for items consumed or put into production during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

Under the general heading "Cost of materials, etc." separate figures were obtained for (a) the total delivered cost of all raw materials, semi-finished goods, parts, components, containers, scrap, and supplies consumed or put into production; (b) the amount paid for electric energy purchased; (c) the amount paid for all fuels consumed for heat, power, or the generation of electricity; and (d) the cost of work done by others on materials or parts furnished by the reporting manufacturing establishment (contract work). The cost of materials figure published for each industry does not include the separately reported cost of products bought and resold in the same condition; also, it excludes the cost of purchased services, such as advertising, insurance, telephone, and research; it excludes overhead costs, such as depreciation charges, rent, interest, etc.; it excludes materials, machinery and equipment used in replacement or expansion of plant or capitalized repairs which are chargeable to fixed assets accounts.

Where the respondent's records did not show the actual amounts consumed or put into production during 1954, he was permitted to enter purchase figures provided purchases closely approximated consumption during the year. For minor materials and supplies, the substitution of purchase records was accepted regardless of the variation between purchases and consumption. If for any major material, however, the two measures differed significantly, the manufacturer was instructed to derive an estimated consumption figure by adding purchases (or receipts) to amounts on hand at the beginning of the year and subtracting amounts on hand at the end of the year. While it was not feasible to audit the resulting figures reported for materials and supplies consumed, enough checks of consistency were made so that it is believed that the aggregates reported are close approximations of actual consumption.

In the case of materials received from other plants of the same company or from a central materials depot (whether at the same or different physical location) the respondent was asked to approximate the commercial value of these materials, including freight and other direct handling charges. For some industries in which there was no satisfactory market counterpart of the transferred material, special instructions were necessary. The respondent was also asked, where possible, to check that such approximated costs exceeded the value of shipments reported by the company's plant producing and transferring the goods only by the addition of freight and other direct charges.

It should be noted that the cost of fuel consumed under (c) above (including anthracite and bituminous coal, natural and manufactured gas, fuel oil, liquefied petroleum gas, and other fuels) does not include fuel used as a material in the manufacturing process, for example, coal used in the production of coke. Such costs were included with other materials costs in category (a) above.

A summation of industry figures for cost of materials would result in large and unknown amounts of duplication in industry group totals, owing to the addition of costs reported by related industries engaged in successive fabrication stages in the production of finished manufactured products. For this reason, cost of materials figures are not shown at the industry group (3-digit) and major industry group (2-digit) levels. With some important exceptions (such as Blast Furnaces and Steel Mills, Radios and Related Products, and Motor Vehicles and Parts) this duplication is not significant within individual industries.

6. Individual Materials Consumed

In addition to the total cost of materials, fuels, etc., which every establishment was required to report, quantity and cost information was collected on the use of 433 specific materials. Consumption information was also collected for an additional 762 items as part of the product sections of the report forms. The latter group typically consisted of items which were produced and also consumed by the producing establishments or by other establishments in the same industry. For example, many chemical plants produced a basic chemical and then used it in further processes. Also in the steel industry, data on receipts and consumption of mill shapes were obtained as part of the inquiry calling for the production and shipments of these shapes.

Materials were covered in two ways. For 230 materials, every industry that consumed appreciable quantities of the material was canvassed so that the data would represent at least ninety percent of the total consumption by manufacturing industries. For the remaining 203 materials, information on consumption was obtained on a more limited basis, generally only from those industries in which the materials were an important part of total material costs. Of the 762 products for which consumption information was obtained, industries accounting for ninety percent or more of manufacturing consumption were covered for about 300 items.

Because American industry uses an enormous variety of materials, the number of materials for which "complete" coverage consumption data (90 percent or higher) were obtained had to be strictly limited. The selection of a particular material for such coverage was, therefore, based on the following criteria:

- (1) The importance of the material as measured by the total value of United States consumption of the material,
- (2) The percentage of total consumption accounted for by manufacturing establishments,
- (3) The availability of consumption information from manufacturers' records,
- (4) In certain instances, other factors such as the strategic importance of the material or the availability of historical data on the use of the material.

The materials included on a limited coverage basis were chosen not only because they constituted important inputs for particular industries but, frequently, because they provided necessary classification-type information and other indirect measures. For example, an industry's production was of a heterogeneous character and materials consumed afforded a better measure of physical output than could be obtained from available production data.

Tabulated data on the materials consumed in an industry are usually shown in the report for that industry. In addition, for the 230 materials covered on a complete basis (see above), consumption by all industries and, frequently, by States is shown in the Summary Volume. The data on materials consumed relate generally to the quantity and cost of materials purchased from other companies or obtained from other plants of the same company. However, for selected materials which are also importantly produced for use within the same establishment, information was requested on such captive production in quantity terms only.

Some undercoverage exists in the statistics for most individual materials. This undercoverage results from the fact that:

- (1) Individual materials consumption information was obtained only from establishments using one of the Census of Manufactures standard forms. For the most part, therefore, plants with fewer than six employees are not represented in the statistics. A rough indication of the effect of short forms on the materials covered can be derived from an analysis of the size of establishment tables which appear in the industry reports in the Industry Volume and in a separate chapter of the Summary Volume.

- (2) Establishments consuming less than a specified amount of a material were not requested to report consumption of the material separately. For the majority of individual materials, the minimum amount was \$5,000.

The use of such cut-offs, as well as short forms, is not believed to have had a significant effect on the totals for most materials. However, for industries where a sizeable proportion of the activity is accounted for by small establishments or where a specified material is used in relatively small quantities, the above limitations may be of some consequence.

In the area of metal mill shapes and castings, the minimum amounts to be reported separately in the 1947 Census were 50 tons for carbon steel shapes, 25 tons for alloy steel and 10 tons for stainless steel, nonferrous mill shapes and castings. The reporting cut-off for each of these metals in 1954 was \$5,000. Because of the dominance of large consuming establishments in the totals for these materials, however, the effect of the difference in cut-offs between the two years is believed to be negligible.

7. Value of Shipments

The amounts under value of shipments both for industries and for individual products or classes of products are the received or receivable net selling values, f.o.b. plant, after discounts and allowances, and excluding freight charges and excise taxes. However, where the products of an industry are customarily delivered by the manufacturing establishments (bakery products, fluid milk, soft drinks, for example) the value of shipments if based on the delivered price of the goods rather than the f.o.b. plant price. For the tobacco and other industries where excise taxes are important, such taxes are covered separately.

Under the general heading of shipments, manufacturers were asked to include all items, made by or for each establishment from materials owned by it, whether sold, transferred to other plants of the same company, or shipped on consignment. Also included were receipts for contract work and for such miscellaneous activities as sale of scrap and refuse, installation work by manufacturing plant employees, research and development work, and repair work. The net selling value of products made in one plant on a contract basis from materials owned by others was reported by the plant providing the materials. The value of products bought and resold without further processing (merchandising) was reported separately and is excluded from the value of shipments figures shown in all tables; the value and cost of resales are, however, shown separately in table 3 of the Industry Volume.

In the case of multi-unit companies, the manufacturer was requested to report the value of products transferred to other establishments of the same company (i.e., other manufacturing plants, separate sales branches, or retail stores) at "the nearest approximation to corresponding commercial values, f.o.b. plant, and not the cost of production."

The industry "value of shipments" is necessarily different from the value of shipments of the group of products regarded as "primary" to the industry. The value of shipments of primary products of an industry (Tables 5 and 6 of the Industry Volume) includes the value of such products reported by all producers, including those establishments in other industries which make these items as "secondary" products. However, that value does not include the value of secondary products of establishments classified in the industry, nor receipts of such establishments for contract work and other miscellaneous activities. The general use of shipments as the basis for valuing the output of manufacturing industries differs from the practice for all censuses except those for 1947 and 1929. The selection of shipments in recent censuses was made in order to facilitate direct reporting from records of sales, shipments, or billings. Value of shipments for 1954 and 1947 may, however, be directly compared with value of products for earlier years. In the first place, it is likely that in earlier censuses many manufacturers valued their output in terms of shipments even though value of production was requested. Secondly, the changes in the value of finished goods inventories for most industries were of minor importance and there was, therefore, little difference between production and shipments in 1954, 1957, and 1939 Censuses. The "value of production" was requested in the 1954 Census for a relatively few industries where such records are generally maintained in place of shipment figures and reporting of the latter would have involved undue difficulty for the respondent. These instances are noted in the tables and descriptive text for the industries involved.

8. Plant Specialization Data

In response to needs expressed by data users, a program of plant specialization statistics was developed for the 1954 Census of Manufactures. These data provide a more exact measurement of the relationship between the output of an industry and the statistics on employment and payrolls, cost of materials, etc., reported by the same industry. The plant specialization data (in table 8 of the Industry Volume and Chapter XI of the Summary Volume) importantly supplement the information presented in the industry tables 5A and 5B.

Specialization for an establishment is computed in two ways. The first computation is in terms of the ratio of all the primary products of the establishment to its total of primary plus secondary products. The second in terms of the ratio of the largest single product class of the establishment to its total of primary plus secondary products. Receipts for contract and commission work as well as other miscellaneous receipts are not included in the plant specialization computation. Establishments are then grouped according to their degrees of specialization at the two levels. The statistics presented in table 8 group establishments in four specialization ranges for most industries: 90 percent or more, 75-89 percent, 50-74 percent, and less than 50 percent. For each of these ranges at the two levels (all primary products and the product class), statistics are shown on employment and payrolls, value added, cost of materials, and value of shipments.

Not all industries or all product classes are included in table 8 in each of the industry chapters. Industries having a high degree of primary product specialization (90 percent or more--see table 3 of the industry chapters) and including only one product class are omitted since the statistics for the specialized establishments would be approximately the same as those for the entire industry. In addition, selected industries having more than one product class as well as particular specialization ranges within a product class may have been omitted in order to avoid disclosing individual company figures.

Certain product classes are primary to more than one industry. The industry classification of establishments primarily producing such classes of products is determined on the basis of the kind of operation performed in the establishment, e.g., making the product from purchased materials or from materials produced at the same location. In the plant specialization data (table 8), product classes primary to two or more industries are shown in each of the respective industries. For each industry, the specialization data by industry and product class include only those establishments producing the class of product in the manner defined (e.g., lubricating oils from purchased materials).

Table 8 of the Industry Volume permits analysis of an industry in terms of the differences introduced by variation among establishments in the degree of specialization in the products of the industry or subgroup thereof. For example, where the ratios of various statistics tend to be different for establishments specializing to different degrees in the products of the industry or in different product classes, such ratios for the industry as a whole would be importantly affected by shifts in product mix. It should be noted that for those industries in which a production process results in the manufacture of by-products or other similarly highly correlated products which are separate product classes in the Census, the degree of specialization in each of the product classes tends to be somewhat lower.

Differences in the degree of integration of production processes within establishments are often more important than the element of product mix. No comprehensive industry by industry measure of variations in production processes among establishments is available in the 1954 Census tables. A partial measure of differences arising from this factor can be derived for some industries through the metalworking operations or other equipment data. For some other industries, data on the production and use of products within the same establishment may be used as an approximate measure.

Statistics for establishments highly specialized in the products of their industry classification are also presented in table 3 of the Industry Volume for industries with a primary product specialization ratio of less than 90 percent. This permits a direct comparison of the statistics for the specialized establishments with the totals for the industry. However, the proportion of the total industry represented by the specialized establishments should be considered in the analytical use of the statistics for such establishments.

PRODUCT CLASS SHIPMENTS AND MATERIALS CONSUMED IN 1954 BY ESTABLISHMENTS SPECIALIZING 90 PERCENT OR MORE IN PRIMARY PRODUCTS OF SELECTED INDUSTRIES AND SELECTED PRODUCT CLASSES

(This table presents material consumption data for establishments specializing 90 percent or more in the manufacture of (1) products primary to the industry in which the establishment is classified (industry specialization and (2) specified product classes (product specialization).

The degree of "industry" specialization is the ratio of primary product shipments of the establishment to the total primary and secondary product shipments of the establishment. The degree of product class specialization is the ratio of shipments of the specified product class to total primary and secondary product shipments of the establishment. Data are not shown for some industries, product classes and materials for a variety of reasons.

Materials listed after the industry title (4-digit code) are those consumed by establishments specializing in primary products of the specified industry. Materials listed after the product class titles (5-digit codes) are those consumed by establishments specializing in the specified product class)

Industry or product class code	Material code	Industry, product class, or material	Value of shipments (\$1,000)	Materials consumed

PRODUCT CLASS SHIPMENTS AND MATERIALS CONSUMED IN 1954, BY ESTABLISHMENTS SPECIALIZING 90 PERCENT OR MORE IN PRIMARY PRODUCTS AND SELECTED INDUSTRY AND SELECTED PRODUCT CLASSES--Continued

Industry or product class code	Material code	Industry, product class, or material	Value of shipments (\$1,000)	Materials consumed		
				Unit of measure	Quantity	Value (\$1,000)
3821		MECHANICAL MEASURING INSTRUMENTS--Continued				
		Establishments with 90 percent or more product specialization--Continued				
38213		Industrial process instruments--Continued				
	361411	Fractional horsepower electric motors.....	...	Number.....	37,390	400
				1,000 lbs. (metal content)...		
	363111	Copper and copper-base alloy insulated wire and cable.....	...	Short ton...	51	31
	331231	Stainless steel mill shapes and forms.....	...		827	1,065
38215		Automatic temperature controls.....	178,484
	331225	All other alloy steel mill shapes and forms.....	...	Short ton...	1,200	596
	331211	Carbon steel bars and bar shapes.....do.....	2,417	454
	331212	Carbon steel sheet and strip.....do.....	9,722	1,784
	331217	Carbon steel wire and wire products.....do.....	40	16
	335119	All other copper and copper base alloy mill shapes and forms	...	1,000 lbs...	11,363	6,215
	335211	Aluminum and aluminum-base alloy mill shapes and forms (rolled, drawn, and extruded).....do.....	1,039	518
	336111	Aluminum and aluminum-base alloy castings.....do.....	1,738	1,251
	336121	Copper and copper-base alloy castings.....do.....	2,880	1,843
				1,000 lbs. (metal content)...		
	363111	Copper and copper-base alloy insulated wire and cable.....	...	Short ton...	369	244
	331231	Stainless steel mill shapes and forms.....	...		1,096	1,245
38216		Other mechanical measuring instruments.....	18,797
	335211	Aluminum and aluminum-base alloy mill shapes and forms (rolled, drawn, and extruded).....	...	1,000 lbs...	35	20
3861		PHOTOGRAPHIC EQUIPMENT:				
		All establishments in industry.....	867,597
		Establishments with 90 percent or more industry specialization.	671,291
	281911	Silver nitrate.....	...	1,000 ounces	16,150	8,553
	361411	Fractional horsepower electric motors.....	...	Number.....	415,237	2,376
		Establishments with 90 percent or more product specialization:				
		Still picture equipment.....	56,370
38611	361411	Fractional horsepower electric motors.....	...	Number.....	35,690	493
38612		Photocopying and microcopying equipment.....	2,944
	361411	Fractional horsepower electric motors.....	...	Number.....	7,000	28
38617		Sensitized paper and cloth except silver halide.....	24,207
	281911	Silver nitrate.....	...	1,000 ounces	85	46

¹These plants consumed additional sulfur-bearing materials (e.g., pyrites and sludge, the cost of which total \$1.4 million).

²The bases of the listed chemical materials consumed by this industry are shown in the appendix.

³Sulfuric acid produced and consumed in the same establishment is not shown here but is a substantial part of the H₂SO₄ used in this industry.

⁴Omitted because of substantial duplication in value of shipments and cost of materials. Specialization and coverage ratios are not meaningful because of such duplication.

⁵Includes materials for S.I.C. Industries: Heating and Cooking Equipment, N.E.C., 3439, and Oil Burners, Domestic and Industrial, 3432.

APPENDIX

BASIS FOR MATERIALS LISTED IN MAJOR GROUP 28 - CHEMICALS AND PRODUCTS

Code	Material description	Basis
147411	Sulfate of potash.....	48% K_2O
261115	Purchased (market) wood pulp.....	Air dry
281111	Sulfuric acid.....	100% H_2SO_4
281135	Spent sulfuric acid used in the manufacture of superphosphate.....	100% H_2SO_4
281151	Sulfuric acid sludge (decomposition acid).....	100% H_2SO_4
281211	Chlorine.....	100% Cl_2
281221	Sodium hydroxide (caustic soda).....	100% $NaOH$
281231	Sodium carbonate (soda ash).....	98-100% Na_2CO_3
281931	Ammonia, synthetic, anhydrous.....	100% NH_3
281935	Ammonium nitrate.....	100% NH_4NO_3
281951	Tetrasodium pyrophosphate.....	100% $Na_4P_2O_7$
281955	Sodium tripolyphosphate.....	100% $Na_5P_3O_{10}$
281961	Nitrate of soda.....	100% $NaNO_3$
281965	Sulfate of ammonia.....	100% $(NH_4)_2SO_4$
281975	Calcium cyanamide.....	100% $CaCN_2$
281991	Phosphoric acid transferred or purchased and used in the manufacture of superphosphate.....	50% H_3PO_4
282211	Aniline.....	100%
282221	Chlorobenzene.....	100%
282241	Nitrobenzene.....	100%
282251	Phenol.....	100%
282261	Phthalic anhydride.....	100%
282271	Styrene.....	100%
282935	Carbon disulfide.....	100% CS_2
282937	Cellulose acetate.....	100%
282945	Ethylene glycol.....	100%
282951	Formaldehyde.....	37% $HCHO$
282955	Maleic anhydride.....	100%
282965	Urea.....	100%
284111	Glycerine.....	100%
284211	Bulk surface active agents, primarily for detergent purposes.....	Active weight
287121	Superphosphate: transferred from other plants or purchased: Normal (22% A.P.A. and less).....	100% A.P.A.
287131	Concentrated (40% A.P.A. and over).....	100% A.P.A.
287151	Concentrated transferred or purchased and used in the manufacture of normal superphosphate.....	100% A.P.A.
293231	Benzol (Benzene).....	100% C_6H_6
